                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          THE THE CONTROL OF SPHINGCHIPLES PLACE
BY THE SEQUENTIAL ACTION OF SPECIFIC TYDROLASES. SOME OF THESE
C ENZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROTEINS:
THE SPHINGCLIPIDS ACTIVATOR PROTEINS (COPROTEINS) (BY SIMILARITY).

C -!- FUNCTION: SAPOSIN A AND SAPOSIN C STIMULATE THE HYDROLYSIS OF
GLUCOSYLCERAMIDE BY BETA-GALACTOSYLCERAMIDASE (EC 3.2.1.45). AND
GLACOTOSYLCERAMIDE BY BETA-GALACTOSYLCERAMIDASE (EC 3.2.1.46).

C GALACTOSYLCERAMIDE BY BETA-GALACTOSYLCERAMIDASE (EC 3.2.1.46).

C GALACTOSYLCERAMIDE BY BETA-GALACTOSYLCERAMIDASE (EC 3.2.1.46).

C GAPOSIN-C APPARENTLY ACTS BY COMBINING WITH THE ENZYME AND ACIDIC
LIPID TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBILIZING
THE SUBSTRATE BY SIMILARITY).

C CREBROSIDE SULFATE BY ARYLSULFATASE A (EC 3.1.6.8), GM1
GANGLIOSIDES BY BETA-GALACTOSIDASE A (EC 3.2.1.23) AND
GLOBOTRIAOSYLCERAMIDE BY ALPHA-GALACTOSIDASE A (EC 3.2.1.23)

C SAPOSIN-B FORMS A SOLUBILIZING COMPLEX WITH THE SUBSTRATES OF THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SPHINGOLIPID HYDROLASES (BY SIMILARITY).

FUNCTION: SAPOSIN D IS A SPECIFIC SPHINGOMYELIN PHOSPHODIESTERASE ACTIVATOR (EC 3.1.4.12) (BY SIMILARITY).

SUBUNIT: SAPOSIN B IS A HOMODIMER (BY SIMILARITY).

SUBCELLULAR LOCATION: Lysosomal (By similarity).

PTM: THIS PRECURSOR IS PROTECLYTICALLY PROCESSED TO 4 SMALL PETTIDES, WHICH ARE SIMILAR TO EACH OTHER AND ARE SPHINGOLIPID HYDROLASE ACTIVATOR PROTEINS (BY SIMILARITY).

SIMILARITY: Contains 2 saposin A-type domains.

SIMILARITY: Contains 4 saposin B-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   s requires a license agreement (S an email to license@isb-sib.ch).

(Natl. Acad. Sci. U.S.A. 99:9509-9514(2002)

FUNCTION: This basic c-type monoheme cytochrome has been found exclusively in the green photosynthetic bacteria, although its role in bacterial photosynthesis is not established. It has an unusually low redox potential compared with mitochondrial cytochrome c. It is reactive with cytochrome c oxidases but not
                                                                                                                                                                                                                                                                                                                                                                                        with reductases.

J. Mol. Evol. 32:379-395(1991).

-I- FUNCTION: RuBisCO catalyzes two reactions: the carboxylation of ribulose 1,5-bisphosphate, the primary event in photosynthetic.

- carbon dioxide fixation, as well as the oxidative fragmentation the pentose substrate in the photorespiration process. Both reactions occur simultaneously and in competition at the same

C. elongation past template-encoded arresting sites. The arresting
sites in DNA have the property of trapping a certain fraction of
celongating RNA polymerases that pass through, resulting in locked
ternary complexes. Cleavage of the nascent transcript by Cleavage
factors such as grea or greB allows the resumption of elongation
from the new 3'terminus. GreA releases sequences of 2 to 3
nucleotides (By similarity).
C. -i- SIMILARITY: BELONGS TO THE GREA/GREB FAMILY.

SUBUNIT: The potassium channel is probably composed of a homo- or heterotetrameric complex of pore-forming alpha subunits that can associate with modulating beta subunits. Heteromultimer with KCNH1/EAG (By similarity).

I-FUNCTION: CATALYZES THE FORWATION OF S-ADENOSYL
METHIONINE AND ATP
-I- CATALYTIC ACTIVITY: ATP + L-methionine + H(2)O
diphosphate + S-adenosyl-L-methionine
-I- COFACTOR: Binds 2 divalent ions, such as magnes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-FEB-1996 (Rel. 33, Created)

J. Bacteriol. 179:1090-1095(1997).

-I- CATALYTIC ACTIVITY: Nitric oxide + H(2)O + ferricytochrome c = nitrite + ferrocytochrome c.

-I- COPACTOR: CONTAINS ONE ATOM OF TYPE I COPPER AND ONE ATOM OF TYPE II COPPER; FAD. TYPE 1 COPPER IS BOUND WITHIN A SINGLE MONOMER, WHILE TYPE 2 COPPER IS HELD BY RESIDUES FROM EACH OF TWO MONOMERS, OF THE TRIMER. NITRITE IS BOUND TO THE TYPE 2 COPPER SITE.

- PSEUDOAZURIN IS THE PHYSIOLOGICAL ELECTRON DONOR FOR THE CU-NIR IN VITRO (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Magnesium;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
